ARCHITECTURE CHAPTER REVIEW

CHAPTER 2 – BASIC HOUSE DESIGN

What did we learn? 5 key ideas

1. There is only 4 basic home designs; 1 Story, 1.5 Story, 2 Story, and Split level
2. The most economical houses to build are 2 story designs
3. The split level house was conceived for a sloping hilly lot
4. A Split level house basement equals 40-60% of the space occupied by the house.
5. One and half story houses are normally recognized by there steeper roofs and dormers

What surprised us?

That traffic circulation is such a big part when designing a home to make sure people can flow easily from room to room making it have maximum efficiency

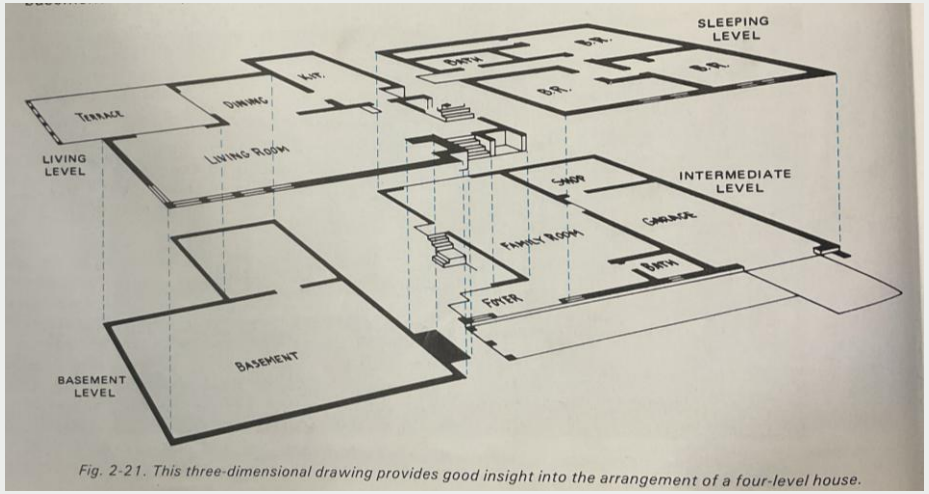

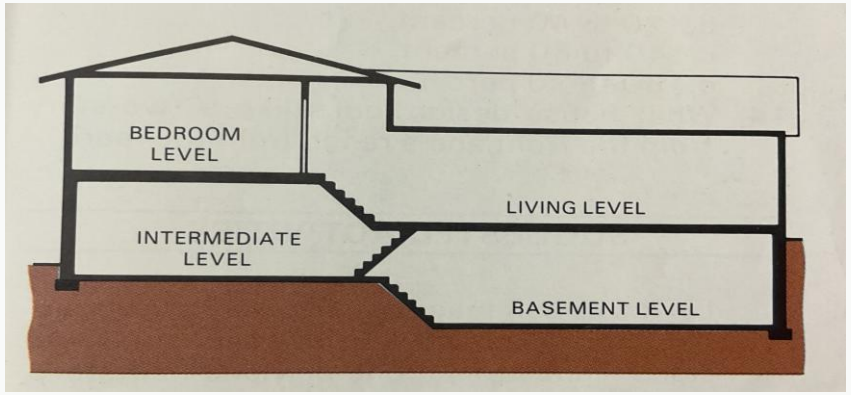

Fig. 2-21. This three-dimensional drawing provides good insight into the arrangement of a four-level house.

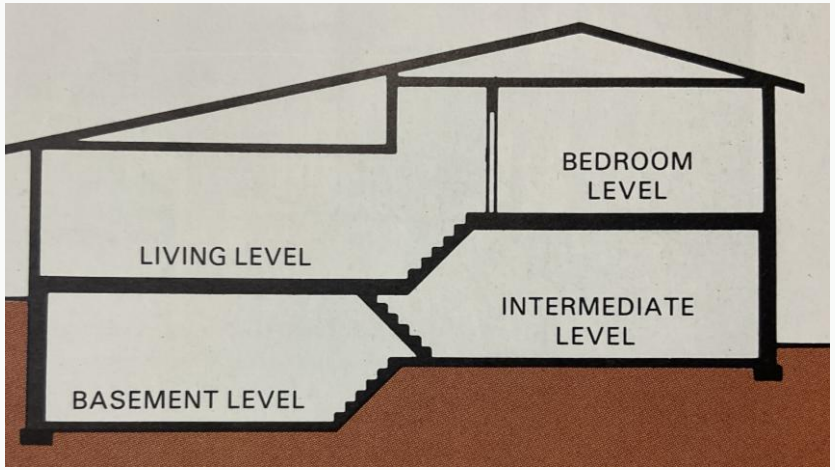

An important example from the book

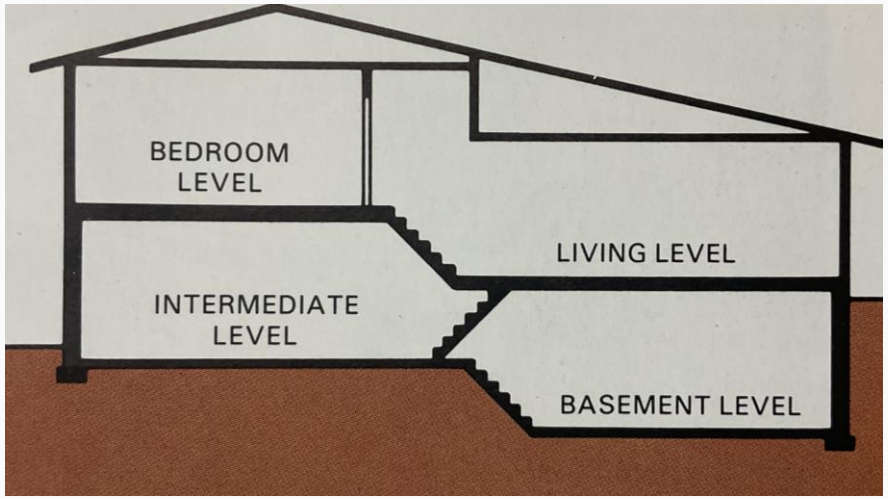

When the book shows the different levels of a house on the Split level design it is a really good visual to show how each floor serves a different purpose to the family, and thought out thoroughly to make sure everything works well.

A Visual

This shows how a split level homes are one of 3 variations. These were good visuals to understand what they all looked like.

Why does this matter?

It is important to understand and know what the 4 basic house designs are. Being able to know which is better or worse for your lot is not only fundamental knowledge for an architect but also for deciding on the design of your own home. It is also important to know how each house flows with traffic circulation.

WHAT TYPE OF BASIC HOUSE DESIGN IS YOUR HOME?
